

GFS' budget-friendly control system for automotive paint booths just got better! Replacing the Axiom Control Panel, the new Engage[®] Control Panel features a simplified, easy-to-use touch screen interface with enhancements such as improved temperature and pressure control and alarm tracking for better, more reliable booth performance.

Color Touch Screen Interface

A four-inch color touch screen interface makes it easy to set up, operate and troubleshoot your paint booth. Booth operation data is conveniently organized on each screen so you can quickly find the information you need. Color coding on screens helps you instantly identify booth statuses and alarms.

Easy to Operate

Engage[®] controls are simple to navigate, with everything you need — time, temperature, fan speed and alarms — located right on the home screen. Color-coded buttons for Spray, Flash, Cure and Stop allow you to quickly select the booth mode.

Alarms & Troubleshooting

If an issue arises with your booth, the Alarm button will change colors to immediately notify you of any warnings or faults. Up to 100 alarms can be logged, along with the date and time, for improved troubleshooting.

Temperature Control & Booth Balancing

The Engage[®] Control Panel features enhanced booth temperature and pressure controls, which allows for cleaner paint jobs and a more consistent cure. Booth pressure can be automatically or manually balanced.
